

# AI Server under GB200 Architecture

## Overview

The NVIDIA DGX GB200 system (Figure 3. 1) is an AI powerhouse that enables enterprises to expand the frontiers of business innovation and optimization. The NVIDIA DGX SuperPOD: Next Generation Scalable Infrastructure for AI Factories Reference Architecture Featuring NVIDIA DGX GB200 is also available as a PDF. Abstract The NVIDIA DGX SuperPOD architecture has been designed to power the next-generation AI factories with unparalleled. To meet that demand, Dell Technologies has introduced a new class of AI optimized servers: the Dell PowerEdge XE8712, purpose built for racks running the latest NVIDIA GB200 Grace Blackwell architecture. In this blog, we break down what makes this platform different and share lab results that show. The NVIDIA GB200 functions as a unified high-performance computing system by combining a Grace CPU and two Blackwell GPUs. These components are interconnected via high-bandwidth NVLink-C2C, enabling seamless data transfer and scalability. These GPUs have different interconnect architectures within clusters. 4 TB of unified GPU memory, and 1. Cloud providers sell access at the Superchip or rack-node level, not as individual GPU slots.
