

Are galvanized cable trays the same as regular cable trays

Overview

Two common types— Hot Dip Galvanized (HDG) and GI (Galvanized Iron) cable trays—offer corrosion protection but differ significantly in performance, durability, and application. Galvanized cable trays are used to support and organize cables in various installations, such as commercial buildings, industrial facilities, and data centers. According to the National Electrical Code standard of the United States, a cable tray is a unit or assembly of units or sections and associated fittings forming a rigid structural system used to securely fasten or support cables and raceways. But which one is better suited for your needs?

In this guide, we'll analyze their differences, advantages, and drawbacks to help you make an informed decision. By the end of this article, you'll understand which type of tray aligns with your facility's.

Cable tray

Common cable trays are made of galvanized steel, stainless steel, aluminum, or glass-fiber reinforced plastic. The material for a given application is chosen based on where it will be used. Galvanized tray may be made of pre-galvanized steel sheet fabricated into tray, or may be hot-dip galvanized after fabrication. When galvanized tray is cut to length in the field, usually the cut surface will be painted with a zinc-rich compound to protect the metal from corrosion.
