

Automated Equipment for Cold Joints

Overview

Cold therapy machines are devices that deliver cold therapy via a wrap or pad to certain areas of your body to relieve aches, pain, and minimize swelling. The machines can be either motorized or non-motorized. If you're anticipating a need for constant, reliable cold packs—such as following a surgery—then a cold therapy machine might be a worthy investment. Like many. These devices do two things simultaneously — deliver controlled cold to the injured tissue and apply intermittent pneumatic compression — and they do it far more effectively than any ice pack on the market. Unlike simpler gravity-fed models, this system uses a whisper-quiet motorized pump to cycle. This machine delivers three types of therapy in one unit: cold compression, deep vein thrombosis prophylaxis, and cryotherapy.
