

Automatic feeding of ceramic inserts

Overview

Insert molding operations can be automated by building a system comprised of an insert workpiece feeder, take-out robot and stocker. Precision sensors and data recording devices were. For many years now, INMATEC Technologies GmbH has been developing and producing feedstocks for the ceramic injection moulding technique. Our feedstocks are used throughout the world. With comprehensive experience of all aspects of the ceramic injection moulding process, we are able to provide. This industry-leading high-speed automatic insert feeder system features a patented design that addresses all major insert feeding challenges. It provides maximum access to all components from one side of the machine while maintaining a compact footprint. By using just a single take-out robot to prepare inserts, place them in molds, and extract and stock the finished products, users save on equipment investment and.
