

CDN and optical modules

Overview

Optical modules, also known as optical transceivers, are devices that convert electrical signals into light waves (and vice versa) for transmission over fiber optic cables. In this post, we'll explore how these tiny yet powerful components optimize CDN performance, reduce latency, and support high-bandwidth demands. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The increasing demand for seamless, high-speed content delivery has placed Content Delivery Networks (CDNs) at the forefront of the digital revolution. To keep pace with this demand, optical fiber has become a foundational technology, offering unparalleled speed, reliability, and scalability. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Huawei offers a comprehensive portfolio of pluggable StarryLink optical modules for data center networks, with various models providing flexible plug-and-play solutions tailored to diverse interface requirements.
