

Can copper wire be used for cable tray connections

Overview

The material used for the manufacture of tray cable is stiff copper wire that is generally used for underground applications. TC cables are rated for 600 volts and can be used in industrial. maintain spacing or to keep cables in place when the tray is ect the minimum bend ra-dius for cables as they exit the bottom of the cable tray. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray cont d for instrumentation and control applications that require. Article 392 of the NEC provides the basic requirements for installations using cable tray. The metal in cable trays may be used as the EGC as per the limitations. Wet-Type Cable (WTTC) or Direct Burial Cable is a ruggedized cable type that can also be placed in rather stringent and hostile conditions, particularly flooding and long earth burials at the beach, where cable damage due to water is not a concern. In accordance with National Electrical Code (NEC) Article 392 "Cable trays" first determine the Maximum Fuse Ampere Rating or Circuit Breaker Ampere Trip Setting or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection s the minimum.
