

# Color of indicator lights for relay protection devices

## Overview

Red: Emergency stop, fault alarms (e., thermal relay activation), or power-off indication. Indicator lights are used to show system processing, failure and functionality. For example, a red light. Color red and a combination of red button with yellow background only for emergency stop Stop/Off Stop/off actuators should be black, gray or white. Do not use red, yellow, green Hold-to-run White, gray or black are for. Emergency Stop button, Master Stop button, Stop of one or more motors. Machine stalled because of overload, etc. (the color RED for the emergency stop. This handbook covers the code of practice in protection circuitry including standard lead and device numbers, mode of connections at terminal strips, colour codes in multicore cables, dos and donts in execution. Also principles of various protective relays and schemes including special protection. Indicator lights are essential components in electronic and electrical equipment, serving as intuitive visual interfaces that convey the operational status of systems through color changes, blinking, or specific display patterns. Attention, caution/marginal condition.
