

Core Switch eor

Overview

An EoR (End-of-Row) switch is a network switch placed at the end of a data-center rack row, aggregating connections from multiple server racks into a centralized switching point. All servers in the row connect to the EoR switch using structured horizontal cabling, typically copper (Cat6A) or fiber. Two common approaches— Top of Rack (ToR) and End of Row (EoR) —offer distinct advantages depending on your operational priorities. To ensure reliability, each row of cabinets is configured. Both approaches have advantages and disadvantages that make them suited to different use cases or teams, with neither being the clear “winner” overall. This blog compares end-of-row vs. top-of-rack deployments based on crucial factors like cost, management complexity, scalability, and resilience to.
