

# DAS System Optical Module

## Overview

Axell's DAS OMU products convert RF signals coming from either BTS or repeater/BDA devices into light for transmission to a remote. Our company as a professional distributed fiber optic acoustic sensing DAS system hardware equipment manufacturers, for different customers, we provide a different system building program, there are 3 ways to build, the following are described. Option 2: Built using separated components such as. Distributed Acoustic Sensing (DAS) systems detect strain changes and vibrations along optical fibers. This highly sensitive technology is used for monitoring critical infrastructure such as power cables, pipelines, or railroad tracks. The technical advantages between the traditional analog fiber remote system and digital fiber remote system have been a controversial topic. I will discuss the differences. The A-POI is an Active Point of Interface used to connect various DAS feeders like Base Transceiver Stations (BTS), small cells, or signal boosters to a PBE Axell Optical Master Unit (OMU) feeding optical repeaters, which in turn feed a remote Distributed Antenna System (DAS).
