

Delivery time of IP54 cold aisle server room

Overview

A: Typically 12-18 months through energy savings (documented cases show 20-40% reductions). Q: Can we retrofit containment in our existing server room?

A: Absolutely! We've completed 150+ retrofit projects with average downtime under 4 hours. Q: How does containment affect fire. In this guide, we'll break down how hot aisle and cold aisle configurations work, what containment systems do, and why airflow management is critical in today's high-density data centers. Whether you need cold aisle containment, hot aisle containment, or a hybrid approach, our expert team ensures maximum thermal efficiency and reduced PUE (Power. Data centers designed and built in the last 10 years are typically capable of cooling up to 3KW of heat load per cabinet. These designs often involve raised floor air distribution plenums 18 to 24 inches in height, room ceiling heights of 8 to 9 feet, and Computer Room Air Conditioning (CRAC) units. Containment systems work by enclosing either the cold aisle or the hot aisle between rows of server racks. The cold aisles are physically enclosed with doors and a roof or panels. Cool air from the raised floor (or overhead ducts) is contained in this aisle. At its core, it strategically separates the cold air—the lifeblood of IT equipment—from the hot air that servers and other. Cold aisle containment (CAC) is a proven data center cooling strategy that creates physical barriers around cold air supply zones, preventing contamination from hot exhaust air and eliminating the energy-wasting effects of air mixing. This approach transforms traditional hot aisle/cold aisle.
