

# Fiber optic cable SPD surge protector

## Overview

The optical power surge protector is a two-fiber port module that has low insertion loss during normal operation, but suppresses an optical power surge quickly (about 100ns) and maintains a preset maximum allowed output power as long as the surge presents. Today's increased reliance on very sensitive electronics makes surge protection an important topic for Fiber to the Home (FTTH) applications deployed in rural, suburban and urban areas. This is achieved by using a detector to. The first rule to comply with is that the length of the SPD connections between the network (via the external SCPD) and the earthing terminal block should not exceed 50 cm. Figure J42 shows the two possibilities for connection of a SPD. Surge-related failures can cause network downtime and service interruptions, which may lead. Surge Protection Devices (SPDs) are an integral component of the electrical installation protection system, that are used for protection against electrical surges.
