

Fiber optic cable breakage caused network outage

Overview

When an internet outage occurs, the source is often a physical interruption to this light path, known as a fiber break. Fiber-optic cables are the backbone of modern connectivity—powering 5G networks, global internet backbones, and data center interconnections with near-light-speed data transmission. While these cables are engineered for durability (with some rated to last 25+ years), they are not invulnerable. Breaks can result from external factors like excavation accidents (e., a backhoe cutting a 10 km backbone), environmental stressors. Fiber optic technology transmits data as pulses of light through thin strands of glass, forming the foundation of modern global communication. These glass threads are bundled within protective cabling that spans continents and oceans. Issues like signal loss, physical damage, and poor connections can degrade performance or cause complete outages. Knowing how to recognize and diagnose these problems quickly ensures.
