

Fiber optic sensor as a strain gauge

Overview

Fiber optic strain sensors are a type of sensor that uses the principles of light and optical fibers to measure strain, deformation, and other physical quantities within a material or structure. Their non-intrusive nature, high sensitivity, and durability have made them popular for a wide range of applications. Optical strain gauges are strain sensors based on optical fibers. This article focuses on Fiber Bragg Grating (FBG) based sensors, a technology embraced by HBK. There are several optical technologies that fit the same classification. Luna's fiber optic sensing solutions deliver strain measurements that go beyond what's possible with traditional strain gages. When this material is stretched or compressed, the physical state of the fibers changes, altering the properties of the light passing through them. Its small size, often the diameter of a human hair, makes it.
