

Function of the optical fiber interface in a switch

Overview

Optical fiber switches are devices that enable data transfer between servers by connecting them through fiber optic cables. They differ from traditional electrical switches by manipulating light paths rather than electrical currents. The technology behind these switches is diverse, including mechanical, MEMS. Fiber optic switch is a kind of optical path controller, which plays the role of converting the optical path. It is the basic component of the optical switching system in the optical fiber communication system, and is widely used in dry optical path monitoring systems and optical fiber sensing. Optical switching represents a fundamental technological evolution, shifting data routing from the domain of electrons to the realm of photons, or light.
