

High-speed photovoltaic interconnects for wind power generation silicon photonics

Overview

Silicon photonics solutions can be implemented from 1260nm to 1570 nm. Enables high speed, low voltage CMOS to be used. Discrete solutions require high voltage drive capabilities (SiGe). Minimizes parasitics between electronics and optics. We present the design and characterization of a dense wavelength-division multiplexing (DWDM) SiPh transceiver chip, featuring a unique architecture in the multi-FSR regime and targeting a shoreline. Large local accelerator clusters need energy-efficient, high-speed, low-latency, dense interconnects that can scale, and the pressure to improve these figures of merit will continue to increase. This whitepaper describes STMicroelectronics' advancements in silicon photonics and BiCMOS technologies. To meet the increasing demand for interchip communication bandwidth, researchers are investigating the use of high-speed optical interconnect architectures. Unlike their electrical counterparts, optical interconnects offer high bandwidth and negligible frequency-dependent loss, making possible. View MZM as tapped delay line (FIR filter) (pat.
