

# How does a fiber optic sensor detect black

## Overview

Fiber optic sensors can distinguish black and white materials by measuring reflected signal intensity and reflectivity. Black materials absorb most incident light and reflect little, while white materials have higher reflectivity. is there a fiber optic sensor that can detect black matt papaer thanks to all I think a bit more detail is required for example is this just to detect a black area on say white paper, or is it to detect black paper present or not. For. There are several options for detecting dark objects. They can detect very small objects, are particularly flexible to mount and are extremely resistant in harsh environments – even in high temperatures. Radiation absorption excites an orbital electron to a higher energy level.
