

How to measure if an optical cable is broken

Overview

Visible cracks, flattened jackets, sharp bends, dirty connectors, and corroded ferrules are typical indicators of cable damage. How do you test a fiber cable for faults?

Use a Visual Fault Locator (VFL) for quick field checks, and an OTDR for detailed fault location and loss. Understanding the visual signs of fiber damage, knowing how to test them, and applying proper maintenance methods can dramatically reduce downtime and improve network reliability. This guide walks you through everything — from field inspection to professional testing standards — used by telecom and. To determine if your fiber-optic cable is damaged, you can follow these steps: 1. Examine the exterior of the fiber-optic cable for any visible signs of damage, such as cracks, kinks, or cuts. Learn to measure loss, detect breaks, and certify links. Fiber optic testing does not require expensive OTDRs for every job. For day-to-day installation and maintenance, an optical power meter and a VFL are the two.
