

Internal part of beam splitter 18

Overview

In its most common form, a cube, a beam splitter is made from two triangular glass prisms which are glued together at their base using polyester, epoxy, or urethane-based adhesives. (Before these synthetic resins, natural ones were used, e.)A beam splitter or beamsplitter is an optical device that splits a beam of light into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as interferometers, also finding widespread application in fibre optic telecommunications. Beamsplitters are often classified according to their construction: cube or plate. Thorlabs offers a wide range of optical beamsplitters. The optical element used here is a vaporized glass pane that transmits about 50% of the light and reflects the other 50% and is used for non-polarizing beam splitters.
