

Is it possible to use aerial fiber optic cables without steel strand

Overview

ADSS is a non-metallic fiber optic cable that can be installed without the assistance of a metal strand. People more widely use these aerial. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Most cable manufacturers offer an assortment of cables for the Outside Plant (OSP) including ADSS and Loose Tube or Ribbon cable designs for. This article explains the common aerial cable types, the hardware you'll actually use on poles and span ends, and the safety practices that keep crews and the network safe — nothing more, nothing less. These may be considerably different from those of the copper cable. Loads that exceed the ratings may increase attenuation in the fibres up to the point of causing fibre breaks.
