

Laying optical cables on slopes

Overview

When laying optical cables in the flat environment by overhead method, use hooks to hang them; when laying optical cables in mountains or steep slopes, use binding methods to lay optical cables. Depending on engineering. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Fiber in a duct solutions have a major aesthetic. Minimize mechanical pressure on the outer sheath at crossing points: (armoured) cables crossing each other generate points of high pressure, so it is important when laying in figure 8 loops it is done in a correct way. Fiber optic cable joints should be set in easy to maintain straight pole locations. Select the best installation method—direct burial, aerial, conduit, or underwater—based on your environment and future network needs.
