

# Lightning protection grounding under the distribution box

## Overview

In North America, distribution systems are often of the 4-wire configuration with three phase conductors and one neutral. The neutrals are typically grounded at equipment locations. For systems located in high lightning regions, the neutral is also grounded where line. Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical. Lightning protection is fire protection through the avoidance of sparks and fire if there is a lightning strike. Knowledge of the various types of system grounding and performance characteristics is critical when designing or operating an electrical system. The voltage, system arrangement, loads connected, and continuity of. In this workshop, we will demystify the concepts of grounding as applicable to utility networks and industrial plant distribution systems as well as their associated control equipment.
