

Making Cable Lugs for Distribution Boxes

Overview

Cable lug manufacturing involves forging annealing copper or aluminum tubes through heavy power presses, followed by drawing processes that reduce diameter and wall thickness, then finishing with electro-tinning for corrosion resistance and optimal conductivity. Cable lugs are the connectors that help in joining cables to electrical equipment, terminals, and buses. You use cable lugs to terminate conductors securely, reduce resistance, and ensure safe current flow in power systems. Achieve the best crimp. Before starting the crimping process itself, you should make sure that the components are clean. Generally speaking, you should ensure that no metal traces. As an experienced aluminum manufacturer, Chalco Aluminum offers a one-stop cable termination solution, covering a full range of copper lugs, aluminum lugs, and bimetal cable lugs, and providing integrated support from design and production to installation. All products comply with IEC 61238, UL.
