

ODF terminations typically use pigtails as the core

Overview

For most enterprise termination work, single-core pigtails are the standard choice. Multi-fiber pigtail bundles are more common in high-density ODF installations and data center applications where dozens or hundreds of fibers need to be terminated in a single panel. Without pigtails, every termination in an ODF, terminal box, or splice closure would require field-installed connectors—an approach that is both time-consuming and less reliable. For procurement managers and engineers, understanding fiber pigtails is not only about knowing another product type, but, whether you're building out an ODF (optical distribution frame) in a hyperscale data center or terminating FTTH drop cables in the field, the decisions you make about your fiber pigtails directly affect long-term network performance and reliability. This article will show you what a fiber optic pigtail is.
