

Oc optical coupler

Overview

In laser science, an output coupler (OC) is the component of an optical resonator that allows the extraction of a portion of the light from the laser's intracavity beam. An output coupler most often consists of a partially reflective mirror, allowing a certain portion of the intracavity beam to transmit through. Other methods include the use of almost-totally reflective mirrors at each end of the c. Partially reflective mirrorIn its most common form, an output coupler consists of a partially reflective, sometimes called a. The reflectance and transmittance of the mirror is usually determined by the gain of the. A cavity dumper is an output coupler that performs the function of a. It allows the energy to build up in the optical cavity and then releases it at a specifically timed interval. This allows the beam to build up to high I.
