

Optical splitter tapered type

Overview

FBT splitter, short for Fused Biconical Taper splitter, is a type of optical power splitter used in fiber optic networks to divide or combine light signals. The optical network system uses an optical signal coupled to the branch distribution. As a basic example, the diagram below shows how light in a. Optical splitters can be classified into two types based on the splitting principle: fused biconical taper (FBT Coupler Splitters) and planar lightwave circuit (PLC Splitters). The FBT method involves fusing and stretching two or more fibers at high temperatures to form a special waveguide. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one.
