

# Optical sub-box communication

## Overview

Optical transceivers for optical sub-assembly are pivotal in enhancing network performance, offering high-speed data transmission and robust signal integrity. One way to connect these fibers is using fiber fusion splicers onsite, but fiber splicing requires highly skilled technicians and can be very difficult if. In the field of modern communications, optical transceivers play a crucial role as essential components in optical communication systems, carrying and transmitting optical signals. For the design and manufacturing of fiber optic transceivers, the choice of packaging methods and optical chip types. Over the years Cube Optics has developed and patented many innovative packaging technologies which make it possible to combine the passive optical multiplexing components with active elements such as lasers, detectors and others. The result of these capabilities and technologies is the ACTIVE-Cube.
