

SFP optical module has no optical power

Overview

The solution is to unplug the fiber and reinsert it into the SFP module interface until a “click” sound is heard, indicating the fiber connector and SFP module are properly connected. Whether you are dealing with a no link light, intermittent connectivity (link flapping), or a transceiver not detected error, the root cause is often not immediately obvious. In many, I noticed something odd with a fiber SFP module. But if I unplug it and then plug it back in, the light appears. To compare, I checked another working SFP — the TX light is visible immediately, and the RX/TX power levels look. Have you ever experienced an unexpected network outage due to the failure of an SFP/SFP+ optical transceiver?

Network outages can bring your ability to communicate and work to a halt, and your IT team will likely be frantically looking for a solution. It is important to understand how to. When SFP failure occurs, it's important for technicians to figure out the reason immediately and repair it, otherwise, the 1 Gigabit link may break out. These faults can affect network stability and, in severe cases, cause network interruptions, resulting in losses.
