

Should I use fiber optic cable or optical fiber for surveillance installation

Overview

Fiber optic cables are the optimal choice for security systems due to their high-speed data transmission, immunity to interference, and resistance to cyber threats. The most common options are Cat5, Cat5e, Cat6, Cat6a, and fiber optic cables. Each has distinct characteristics, making them suitable for different. There are three ways to cable IP surveillance cameras those being UTP (unshielded twisted pair) premises cabling (Cat5e/6), fiber optics, and existing (or new) coax cables. Each type of cabling has its positives and potential limitations. Most installers are familiar with and are using Cat5E/6. Networking, digital and Internet Protocol (IP) have ushered in unshielded twisted-pair (UTP) cable and high-speed Ethernet, employing IP to carry the digitized video images. In some installations wireless transmission-radio-frequency, microwave, WiFi and mesh nets-play a role. It's simpler, more economical, and allows for greater distances when designing a network for IP cameras.
