

Single-mode to multimode fiber coupling efficiency

Overview

The coupling efficiency depends upon the overlap integral of the Gaussian mode of the input laser beam and the nearly Gaussian fundamental mode of the fiber. When we need. Abstract: We demonstrate the fabrication of a high performance multi-mode (MM) to single-mode (SM) splitter or “photonic lantern”, first described by Leon-Saval et al. Our photonic lantern is a solid all-glass version, and we show experimentally that this device can be used to achieve. ngths with coupling efficiencies as high as 80%. Whilst this value is easily achievable when laser light is coupled into multimode fibres, for single-mode fibres, 80% efficiency is close to the theoretical limit, and presents a number of significant challenges especially at powers higher than a few. When using a multimode fiber, the coupling focal length is calculated from the beam diameter and the nominal fiber NA A coupling focal length too long can cause insufficient mode mixing, resulting in unwanted beam characteristics, while a focal length too short will reduce the coupling efficiency. This method only works for multi-mode fibers that contain a large number of modes.
