

Using pigtail fiber for loop testing

Overview

An alternative method of testing fiber, which may be easier in field measurements, involves using a fiber pigtail attached to the source for a launch cable. Then use a temporary fusion or mechanical splice on the other end to connect to the fiber to be tested. There are two reasons we may want to test bare fiber, by that we mean fiber that has not been terminated in connectors but is simply plain optical fiber. The first one is to ensure the fiber or cable being manufactured meets its specifications, as is done by every manufacturer. The second reason is. OptiFiber Pro SmartLoop OTDR enables automated testing and analysis of two fibers in a single test. Whether used in pre-deployment testing or ongoing diagnostics, fiber loopback cables are important tools for maintaining optimal network operations and. Looping back fiber is a fundamental technique used in fiber optics for testing network components, particularly optical transceivers and active network ports. This application note focuses on how the OSA20's Recirculation Loop Transmission (RLT) mode can provide.
