

Viewing VLANs on Huawei Core Switches

Overview

After configuring VLAN switching, you can use the `display vlan-switch` command to verify the configuration. `display vlan-switch [vlan-switch-name | interface interface-type interface-number]` Specifies the name of a VLAN switching entry. The value is a string of 1 to 32 characters. When double quotation marks are used around. This article will introduce in detail the nine query commands of Huawei switches to help you quickly understand the operating status and configuration information of the device, so as to better conduct network management and troubleshooting. For example: Replace USERNAME with the new username, set the password, define service-type (telnet, ssh, etc.), and specify the access level (1-15). Verify that your settings are configured correctly using commands like `display local-user`. You can download this configuration on Huawei. Configuring a Huawei switch to assign an IP address to VLAN 1 and binding multiple ports to it can seem challenging, but this step-by-step guide simplifies the process.
