

# What does surveying for cable tray and fiber optic cable construction count as

## Overview

The first and most critical step in fiber optic network construction is the site survey—also known as a field survey. From the initial site survey to the final fiber to the home (FTTH) connection, every stage requires careful planning, coordination, and execution. While there are several specific types of listings for power cables, specifically for tray. Routes must be surveyed, ground conditions tested, all components procured and received. Permits from local authorities must be obtained and coordination with local agencies such as traffic and police must be properly planned. If poles exist already, it is required to have proper permits for adding. The installation of fiber optic infrastructure requires detailed fiber optic route survey drawings that describe the type of communication systems required, the geographic layout, the transmission equipment to be used, and the required fiber optics network, as well as terrain details, obstacles.
