

What is FTAT Fitat Distribution Box

Overview

A Fiber Access Terminal (FAT), also known as a Fiber Access Terminal Box (ATB) or Fiber Distribution Terminal (FDT), is a key component found in optimized fiber optic access networks for FTTH implementations. It is the junction point between the distribution fiber cables and the drop cables that. A FAT Box (Fiber Access Terminal) is a passive FTTH enclosure used to: In simple terms: A FAT box is the physical interface between the FTTH distribution network and end users. It is often the final distribution node before customer premises. It provides a secure and organized point for fiber cabling, splicing, splitting, and distribution, while ensuring reliable protection and easy management for long-term. FAT, FDB, and CTO boxes are three common types of fiber termination and distribution hardware used in FTTH and outdoor access networks. Their differences lie in internal structure, cable routing capacity, waterproofing, port configuration, and whether they support pre-connectorized or splice-based. FTTH networks, which bring high-speed internet directly to residential areas, are composed of several key elements.
