

# What is the optical module interface packaging

## Overview

Plug-in packaging is to package the optical module in an independent plug-in and complete the connection by inserting it into the slot of the optical communication equipment. That is, metal medium communication represented by coaxial cables and network cables is gradually being replaced by optical fiber media. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Although packaging, product appearance, and electrical interfaces are standardized, optical modules involve a significant amount of design and process experience. It mainly performs photoelectric and electro-optical. The unsung heroes behind this "data voyage" are optical modules—the "optical communication translators" that precisely convert electrical and optical signals. There are many types of optical modules, and there are several standard ways to categorize them, such as according to different package forms, different.
