

What media are cables and optical fibers

Overview

Copper-based or fibre-based transmission media are used to carry either electric or optical signals. An optical fiber, or optical fibre, is a flexible glass or plastic fiber that can transmit light from one end to the other. Such fibers are widely used in fiber-optic communication, where they permit transmission over longer distances and at higher bandwidths (data transfer rates) than. Transmission media refers to the physical or wireless communication channel used to carry data signals from one device to another within a computer network. It forms the fundamental pathway through which information is transmitted, ensuring connectivity between networked devices.

Multimode fiber cables are generally categorized in five different types: FDDI-grade: This type was among the first types of fiber cables that became widely deployed.

How optical fibers are made from silica glass Learn how optical fibres are created out of a piece of silica glass in this video. In telecommunications, fiber optic technology.

The most popular conductive media used in networking are unshielded twisted- pair (UTP) cable, shielded twisted-pair cable (STP), and coaxial cable.
