

Which type of power distribution is Iranian electricity

Overview

Electricity generation in Iran utilizes diverse sources including thermal power plants, hydroelectric power plants, nuclear power plants, and renewable energy sources. There are [as of?

] plans to add more than 5,000 MW of generation capacity annually to the power grid, which would almost double the total power generation. Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country. output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land ed by NREL, measured at a height of 100m. We look at electricity consumption later in this.
